

Inet Device Ethernet Seasoninterface

1. What is Ethernet Seasoninterface ?

Inet Seasoninterface provides your digital receiver its information via your local network or the Internet instead of the local smartcard. This means that you can locate your smartcard somewhere else instead of having it directly in your receiver. For example in your cardserver or dreambox. Some people call this "cardsharing".

2. What do I need, what does it do ?

7.5 Volt Adapter, a local network or an internetconnection (router) and a cardserver with radegast, newcs or newcamd. With this equipment you can start and connect to your cardserver or dreambox.

3. Which receivers are supported ?

The best supported receiver is the **Humax 5400** but also **Goldboxes**, and several **CI-Modules** are supported, so you can use every receiver which has a CI-Slot and one of the supported cams, like **irdeto**, **seca**, **conax**, **matrix**, **alphacrypt** etc.

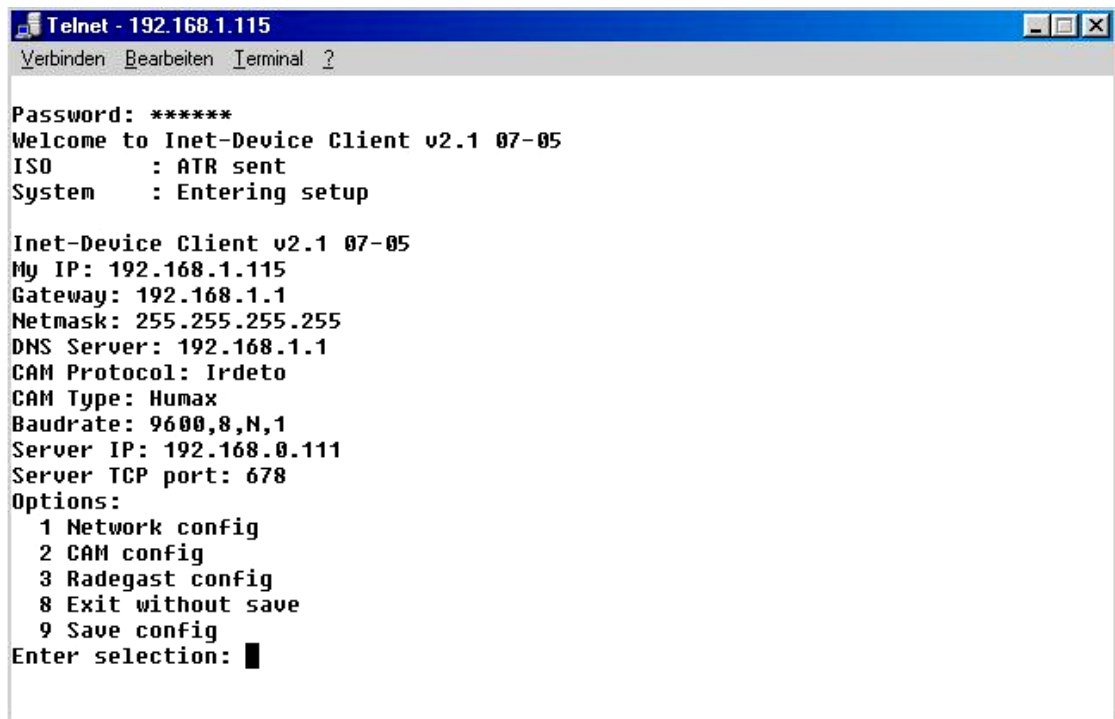

4. What can I receive with this Seasoninterface ?

Sky Italia NDS, C+ FR, C+ NL, CYFRA+, Digital+, Premiere, Nova and much more.

5. How do I configure this Seasoninterface ?

Via Telnet, for example, usage telnet 192.168.0.1 18081

You configure the Seasoninterface via your local network, dhcp is preconfigured.

```
Telnet - 192.168.1.115
