

Howto OSEmu:

install the plugin and start it via /menu/plugin (don't forget to enable autostart!)

add the following reader to oscam.server:

```
...
[reader]
label = OSEmu
protocol = camd35
device = localhost,54321
user = emu
password = emu
group = 1
audisabled = 1
caid = 0D00,0D02,0D03,0D05,090F,0500,0604,1801
add also the caid's to oscam.dvbapi:
...
P: 0D00
P: 0D02
P: 0D03
P: 0D05
P: 090F
P: 0500
P: 0604
p: 1801
```

Restart oscam via menu/plugin!

Note: if you start OSEmu without any parms (for example via /menu/plugin) the default is:

'-a emu:emu -c /var/tuxbox/config -p 54321'

>=1.02n: There are NO keys inside OSEmu! you have to place the file 'SoftCam.Key'* in path '/var/tuxbox/config' or path '/var/keys' (basically in the same path where the oscam.* files resides)

* for example from skystar.org

README: <https://github.com/oscam-emu/OSEmu/blob/master/README>

possible commands for OSEmu:

Usage: /var/bin/OSEmu -a <user>:<password> -p <port> [-f -v -c <path> -l <logfile>]
-f enables to start in foreground - default is background (as a daemon)
-v enables a more verbose output (debug output)
-c sets path of SoftCam.Key
-l sets log file
-h help
